Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.The overall project goal is to understand the fundamental gas phase, and surface and interface science issues relevant to low-temperature (T less than 600oC) synthesis of polycrystalline silicon films on low-cost (e.g., glass) substrates. This understanding will be used to delineate the path to break through existing barriers to high-rate synthesis of high-quality thin films for polycrystalline silicon photovoltaic applications. In this context, high quality P refers to large grain size (greater than film thickness) and long (greater than film thickness) minority-carrier diffusion length.
